Commit Week #3

Possible things to include for flask project folder

- 1.) Project_Name
 - a. Init.py
 - b. Templates
 - i. Views (html templates)
 - ii. Styles (CSS files)
 - iii. JS files
 - c. Static (static assets)
 - i. Favicon.ico
 - ii. Images
 - d. Models (for database models)
 - e. Makefile
 - f. Tests (contains unit testing stuff)
 - g. Utils (the generic utils repo)
 - h. Endpoints.py (generic boilerplate endpoint file) basically app.py in most project.
The entry point
 - i. README.md
 - j. Requirement.txt
 - k. Config / env file (some file to hold all the environment variables for the application)

Every website or web app should have like a endpoints.py. (Indra has api_endpoints.py)

A folder filled with unit tests might be useful

Models could be for websites that have a database that the application might use.
