

Name: David Zheng

Course: DevOps

Assignment: Week 2 Commit

1.) 3 things we can do with WayScript in software production

- a. Trello Trigger
 - i. If something changes on the trello board, get a slack notification so the team members know what is going on with the tasks without having to actively log into trello
 - ii. Alternative would be a github trigger that does the same thing whenever an issue is closed or open
- b. Github push/pull notification
 - i. Get notified on slack when a branch (probably master) gets changed
- c. Testing
 - i. Once a github change has been made and pushed to a branch or master
 - ii. WayScript could make an API request to an API endpoint that you might have been working on.
 - iii. Then, using the python module in WayScript, you might be able to check if the results you got back was what you were expecting from the API.
