Commit 3 Part 2

Flask Shell Script Plan

1. The script should create a new directory with the typical structure used for a flask project (such as app.py file, configuration file, makefile, pytest, testing folders, templates(optional), etc.)

2. The script should make sure that any requirements already installed (such as flask or python).

3. The script should be called in the following format ./initial_flask_setup.sh [directory] [template], if the templating is called as well, we can include some generic templating files. Otherwise, we leave the folder empty.
